Adventist University of Central Africa (AUCA)
Kigali, Rwanda

1. Introduction

1.1 Project Background

The Smart Service Failure Refund System (SSFRS) is an AI-powered platform designed to manage the full lifecycle of service contracts between project providers and workers. The system introduces an automated, fair, and transparent mechanism for worker selection, contract execution, dispute resolution, and financial refund processing when services are delivered inadequately or not at all.

The platform leverages artificial intelligence as a central mediator, ensuring that worker assignments are merit-based, that claims are analyzed objectively, and that evaluators receive structured, evidence-backed reports to support final decisions.

1.2 Problem Statement

In many service marketplaces, project providers face significant risks when engaging workers for project delivery. Common problems include:

- Lack of objective, verifiable worker performance history
- Absence of a structured dispute resolution process when services fail
- Delayed or inconsistent refund processing after service failures
- No formal accountability mechanism for workers with repeated failures
- Difficulty gathering and validating evidence during disputes

SSFRS addresses all of the above by embedding AI at every critical decision point in the system workflow.

1.3 Project Objectives

- Provide an AI-driven worker rating and matching engine based on verifiable performance criteria
- Enable project providers to post projects and select workers from AI-ranked candidates or accept AI auto-assignment
- Implement an AI-mediated claim and dispute resolution pipeline with document proof validation
- Establish a structured evaluator review process with AI-generated analysis reports
- Automate refund initiation to project providers upon evaluator approval
- Maintain system-wide accountability through admin oversight and worker reputation tracking

2. System Overview

2.1 High-Level Description

The Smart Service Failure Refund System is a multi-actor, AI-mediated platform operating across five distinct user roles. It governs the entire service delivery lifecycle: from project posting and worker assignment, through contract execution and dispute filing, to evaluator ruling and financial refund processing.

At the core of the system is an AI Engine that performs four primary functions:

- **Worker Rating:** Scores workers based on CV analysis, completed projects, years of experience, client feedback, and failure history.
- **Worker Matching:** Ranks eligible workers for a given project, enabling AI auto-assignment or provider-driven selection from a ranked list.
- **Claim Mediation:** Notifies the accused worker when a claim is filed, collects their feedback, and analyzes the exchange to determine fault, misunderstanding, or admission.
- **Document Validation:** Checks uploaded proof documents against the claim to assess their relevance and authenticity before forwarding to evaluators.

2.2 Core System Workflow

The system follows a clearly defined operational flow:

- **Step 1 — Project Posting:** A project provider registers and posts a project with requirements and budget.
- **Step 2 — Worker Assignment:** The AI ranks qualified workers. The provider selects from the list or accepts the AI's top recommendation.
- **Step 3 — Contract Execution:** The assigned worker delivers the project within the agreed scope and timeline.
- **Step 4 — Claim Filing:** If the project fails or is incomplete, the provider files a claim and uploads supporting proof documents.
- **Step 5 — AI Mediation:** The AI notifies the accused worker, collects their response, and validates proof documents. It produces an analysis report indicating fault or misunderstanding.
- **Step 6 — Evaluator Review:** Evaluators (created by Admin) review the AI analysis report and make the final ruling on the claim.
- **Step 7 — Refund Processing:** Upon evaluator approval, the Refund Office processes the financial refund to the project provider.

3. System Actors

The SSFRS involves five human actors and one AI actor. Each plays a distinct role in the system lifecycle. The table below provides a high-level overview before each actor is described in detail.

Actor	Role	Key Responsibilities
Project Provider	Service Client	Posts projects, selects workers, files claims, receives refunds
Worker	Service Executor	Submits CV, receives AI rating, gets assigned to projects, responds to claims
Admin	System Manager	Controls the system, manages all users, creates evaluator accounts
Evaluator	Dispute Adjudicator	Reviews AI analysis of claims and issues final rulings
Refund Office	Financial Processor	Processes approved refunds to project providers
AI Engine	Intelligent Mediator	Rates workers, matches projects, mediates claims, validates documents

3.1 Project Provider

Role Type: Primary Client / Service Consumer

The Project Provider is an individual or organization that registers on the platform to outsource specific projects or tasks to qualified workers. They initiate the service engagement cycle and are the primary beneficiary of the refund mechanism in case of service failure.

Responsibilities:

- Register and create an account on the SSFRS platform
- Post project details including scope, requirements, deadline, and budget
- Choose between AI auto-assignment or manually selecting from the AI-ranked worker list
- Monitor project progress and mark delivery status
- File a formal claim with supporting evidence (uploaded documents) if the project fails or is incomplete
- Receive AI-mediated communication and dispute updates throughout the claim process
- Receive a financial refund upon evaluator approval of a valid claim

Key Interactions:

- **With AI Engine:** Receives worker ranking results; submits claim which triggers AI mediation
- **With Worker:** Indirect — through AI mediation during the claim process
- **With Evaluator:** Indirect — evaluator reviews the AI report of their claim
- **With Refund Office:** Receives financial refund upon approved claim

3.2 Worker

Role Type: Service Executor / Freelancer

The Worker is an individual who registers on the platform seeking project assignments. They submit their professional credentials through a CV, which the AI Engine analyzes to generate a comprehensive rating score. Workers are ranked and assigned to projects based on this score, their experience, and their track record on the platform.

Responsibilities:

- Register and upload a professional CV to the platform
- Receive an AI-generated rating score based on submitted credentials and performance history
- Appear in AI-ranked candidate lists for relevant project postings
- Accept project assignments and deliver work as per agreed scope and timeline
- Respond to claim notifications sent by the AI Engine when a project provider files a dispute
- Provide a counter-response or acknowledgment of fault during the AI mediation process

AI Rating Criteria:

- **CV and Qualifications:** Educational background, certifications, and technical skills extracted from the uploaded CV
- **Years of Experience:** Total professional experience in the relevant domain
- **Successfully Completed Projects:** Number and quality of projects completed on the platform
- **Client Ratings & Feedback:** Average ratings received from project providers post-delivery
- **Failure Report History:** Number and severity of past project failures; workers with high failure counts receive score penalties

Key Interactions:

- **With AI Engine:** CV is analyzed for initial rating; receives claim notifications; submits feedback during mediation
- **With Project Provider:** Indirect — through the AI mediation layer during disputes

3.3 Administrator (Admin)

Role Type: System Controller / Platform Manager

The Administrator is the highest authority in the system. They are responsible for the overall health and integrity of the SSFRS platform. A key administrative function is the creation and management of Evaluator accounts — Evaluators do not self-register but are provisioned exclusively by the Admin.

Responsibilities:

- Manage all user accounts: Project Providers, Workers, Evaluators, and Refund Office staff
- Create, assign, and deactivate Evaluator accounts
- Monitor system-wide activity, claim pipelines, and refund statuses
- Configure AI Engine parameters and rating criteria weights
- Handle escalated disputes or edge cases outside normal workflow
- Generate system reports and audit logs
- Manage platform settings, security policies, and access control

Key Interactions:

- **With Evaluators:** Creates and manages evaluator accounts; assigns evaluators to active claims
- **With All Actors:** Has full visibility and override capability over all system entities
- **With AI Engine:** Configures rating parameters and may review AI analysis quality

3.4 Evaluator

Role Type: Dispute Adjudicator / Claim Reviewer

The Evaluator is a trusted platform-appointed reviewer whose account is created exclusively by the Admin. Their primary function is to review AI-generated claim analysis reports and make final, binding rulings on disputes. Evaluators rely on AI summaries, validated proof documents, and mediation transcripts to reach their decisions.

Responsibilities:

- Review the AI-generated mediation and analysis report for assigned claims
- Examine all uploaded proof documents that have been validated by the AI
- Review AI recommendations on worker eligibility and project assignment quality
- Issue a final ruling: approve refund, reject claim, or request additional information
- Document reasoning behind rulings for audit and accountability purposes

Key Interactions:

- **With AI Engine:** Receives AI analysis report and AI recommendation as primary decision support material
- **With Admin:** Account is created and managed by Admin; escalates unresolvable cases to Admin
- **With Refund Office:** Approved ruling triggers the Refund Office to initiate financial processing

3.5 Refund Office

Role Type: Financial Processor

The Refund Office is the financial arm of the platform, responsible for executing refund payments to project providers whose claims have been approved by the Evaluator. The Refund Office does not make judgments about claims — it acts solely on approved rulings from the Evaluator.

Responsibilities:

- Receive approved refund orders from the Evaluator
- Verify the financial details of the project provider's account
- Process and disburse the refund amount to the project provider
- Maintain a record of all refund transactions for audit and reporting purposes
- Communicate refund status (initiated, completed, failed) to the project provider and admin

Key Interactions:

- **With Evaluator:** Receives approved refund orders to process
- **With Project Provider:** Disburses funds and communicates transaction status
- **With Admin:** Reports on refund pipeline and flags anomalies

3.6 AI Engine (Intelligent Mediator)

Role Type: Automated Actor / Core Intelligence Layer

The AI Engine is not a human actor but functions as an autonomous system participant that underpins every major decision in the SSFRS workflow. It acts as a worker rater, a project matcher, a dispute mediator, and a document validator. Its outputs are designed to support — not replace — human decision-making by Evaluators.

AI Capabilities Summary:

AI Capability	Description
Worker Rating	Analyzes uploaded CVs and platform history to generate a composite rating score for each worker, factoring in qualifications, experience, completed projects, client feedback, and failure reports.
Project Matching	Ranks workers by suitability for a given project posting. Supports both AI auto-assignment (top match is automatically assigned) and provider-assisted selection (provider chooses from a ranked shortlist).
Failure Penalization	Workers with a history of project failures receive rating score reductions proportional to the number and severity of reported incidents. This ensures underperforming workers appear lower in candidate rankings.
Claim Notification	When a project provider files a claim, the AI Engine automatically notifies the accused worker and requests a formal response within a defined time window.
Response Analysis	Analyzes the worker's feedback response to determine whether the situation represents an admission of fault, a misunderstanding, or a counter-claim. Produces a structured mediation report.
Document Validation	Reviews uploaded proof documents submitted with a claim to verify they are relevant, sufficient, and authentic before the claim can proceed to Evaluator review.
Evaluator Support	Provides evaluators with a comprehensive analysis report including mediation transcripts, document validation results, worker rating history, and a recommendation.

4. Actor Interaction Summary

The diagram below describes how all actors interact within the two primary workflows of the system: Project Assignment and Claim/Refund Processing.

4.1 Project Assignment Workflow

Actor	#	Action
Project Provider	1	Posts project with requirements and budget
AI Engine	2	Analyzes eligible workers and generates a ranked candidate list
Project Provider	3	Selects a worker from the AI-ranked list OR accepts AI auto-assignment
Worker	4	Receives assignment notification and begins project delivery
Project Provider	5	Reviews delivery and marks project as completed or failed

4.2 Claim & Refund Processing Workflow

Actor	#	Action
Project Provider	1	Files a claim against a worker with description and uploads proof documents
AI Engine	2	Validates the uploaded documents for relevance and sufficiency
AI Engine	3	Notifies the accused worker and requests their formal response
Worker	4	Submits feedback response (admission, counter-claim, or explanation)
AI Engine	5	Analyzes mediation exchange and produces structured analysis report
Admin	6	Assigns the claim to an available Evaluator
Evaluator	7	Reviews AI report, documents, and worker history; issues final ruling
Refund Office	8	Receives approved ruling and processes financial refund to provider
Project Provider	9	Receives refund payment and claim closure notification

5. Glossary

Term	Definition
SSFRS	Smart Service Failure Refund System — the full name of this platform
AI Engine	The artificial intelligence module embedded in the platform that performs rating, matching, mediation, and document validation
Project Provider	The client who posts projects and pays for services on the platform
Worker	The service executor who delivers projects in exchange for payment
AI Rating Score	A composite numerical score assigned to each worker by the AI Engine based on multiple performance and credential criteria
Claim	A formal dispute filed by a project provider when a project has failed or been delivered incompletely
Mediation Report	The structured document produced by the AI Engine after analyzing a claim and the worker's response
Evaluator	A platform-appointed human reviewer who issues the final ruling on a claim after reviewing the AI mediation report
Refund	The financial payment returned to a project provider following an approved claim ruling
Failure Penalization	The mechanism by which a worker's AI rating score is reduced based on their history of project failures
